OUR MEASURES

Photovoltaics

Our photovoltaic system on the company roof produces environmentally friendly electricity directly on site. This means that we cover a large part of our energy needs from renewable sources.

LED lighting

At our headquarters, we use modern LED lighting. This technology consumes up to 80% less energy than conventional light sources and has a significantly longer lifespan.

E-bills

By switching to e-bills, we are reducing our paper consumption and making our processes more efficient and environmentally friendly. It's a simple step that has a big impact on sustainability.

Unpainted packaging

Some system packaging is more environmentally friendly than others, depending on the materials used. The SIHGA® objektpack deliberately dispenses with sub-packaging and does not varnish the cardboard boxes.

Sustainable pallet film

Our new pallet film is material-efficient and significantly reduces packaging waste. This results in less waste, which not only protects the environment, but also makes disposal easier.

Return of used screws

To conserve resources, we promote a closed material cycle. Our customers have the option of returning used screws from SIHGA®, which we then recycle in an environmentally friendly manner.

Made in Austria

Around 80 % of our products are made in Austria and Germany – this means regional production, the highest quality and short transportation routes. This strengthens the domestic economy, reduces CO₂ emissions and makes an active contribution to environmental protection.

Packed in Austria

Most of our products are packed by hand in Austria with the utmost care. This is how we ensure regional jobs and guarantee the highest quality. At the same time, we rely on short distances and environmentally friendly processes.

CO₂-binding timber construction

The majority of our products have been specially developed for timber construction and thus support sustainable building. Wood stores CO₂ over the long term, so our innovative product solutions actively contribute to the reduction of emissions.

E-mobility & charging stations

Charging stations for electric vehicles are available on our company premises, enabling convenient charging of electric vehicles. In addition, our fleet consists largely of electric cars.

Electric pallet trucks

Our company relies on electric ground vehicles for environmentally friendly in-house transportation. These vehicles enable emission-free logistics processes and are quiet and efficient.

Company e-bike

After working for the company for a longer period of time, our employees can take advantage of a company bike (firmenradl.at). This makes commuting and everyday life more environmentally friendly.
